                         The present invention relates to a sequence capable off binding specifically to a CD109 nucleic acid which has a single nucleotide polymorphism that distinguishes the Gova and Govb alleles. Detection of the Gov genotype is useful for detecting whether the subject has or is at risk of a blood disease, disorder or abnormal physical state, such as bleeding, or increased risk of bleeding, due to alloimmune destruction of blood platelets, e.g., post-transfusion purpura, post-transfusion platelet refractoriness or meonatal alloimmune thrombocytopenia. The nucleic acid and polypeptide are useful for Gov genotyping or phenotyping individuals. The present sequence is the Govb encoded protein.
                                                                                                                                                                                                                                 New isolated oligonucleotide binding to a region of CD109 nucleic acid having a single nucleotide polymorphism that distinguishes a Gova and/or Govb allele, useful for treating blood disorders e.g. alloimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     channels and transporters. The present sequence is a human protein which has at least one hydrophobic domain. This protein may be a secretory or a membrane protein. The present protein may have cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis activity, tissue growth activity, haemostatic and thrombolytic activity, anti-inflammatory activity, haemostatic and thrombolytic activity, anti-inflammatory activity and tumour inhibition activity. The present protein could therefore be used for treatment of autoimmune disease, Alzheimer's disease, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Secretory proteins play important roles in the proliferation control, differentiation induction, the material transport and the biophylaxis differentiation induction, the material transport and the biophylaxis chils. Membrane proteins have important roles as signal receptors, ior chils.

The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human blood cell surface antigen, CD109. CD109 is a variant of r150 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta useful for negatively modulating TGF-beta activity, and thus for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24-APR-2001;

The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human r150 protein.

                                                                                 S
                                                                                                                                                                                                                                         The invention relates to isolated nucleic acid molecules encoding CD109 CC polypeptides. These nucleic acid molecules include the human cDNA CC sequences comprising CD109 K1. CD109 K1-H7, CD109 K15 or their variants. CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 cf family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CC CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful CC for treating or detecting a disease or disorder, e.g. conditions CC associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of T lymphocytes and of the complement system, quantitative or qualitative abnormalities CC and of the complement system, quantitative or qualitative abnormalities CC of platelet function, increased or impaired activation of the coagulation and cativation, increased or impaired activation of the coagulation and/or CC fibrinolytic systems, or impaired activation of the coagulation and/or CC infarction, thrombosis, embolism, peripheral vascular disease, organ CC transplantation, or bone marrow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for CC cD109 K15 segmence
                                                                                                                            Matches 1062;
                                                                                                                                            Best Local Similarity
                                                                                                                                                             Query Match
                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombosis, thrombocytogenia, autoimmune diseases, or organ or bone marrow transplantation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 21; Fig Sa; 156pp; English.

These are also useful for treating cardiovascular disorders, stroke, myocardial infarction, thrombosty, embolism, peripheral vascular disease, thrombostytopenia, thrombostytemia, autoimmune diseases, organ transplantation, or bone marrow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for
                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated nucleic acid molecules encoding CD10; polypeptides. These nucleic acid molecules include the human cDNA sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variant; CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, (family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombosis, thrombocytopenia, autoimmune diseases, or organ or bone marrow transplantation -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-betal binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human blood cell surface antigen, CD109. CD109 is a variant of r150 sequence.

Note: This sequence is stated to be encoded by human CD109 DNA shown in figure 17 of the specification, but this does not appear to be the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta useful for negatively modulating TGF-beta activity, and thus for

                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes 3 variants of human unc-5C cDNAs (unc-5CC), unc-5CC, and unc-5CB) which correspond to alternatively spliced unc-5C transcripts, and a human unc-5HS1 cDNA which shares homology with the Rattus norvegicus unc-5HS1 cDNA. Also described are assays based on protein-protein-interactions between the unc-5 protein and a variety of different interacting proteins. The unc-5 variant cDNAs and unc-5HS1 cDNA are useful in methods for identifying compounds which reduce or inhibit the lethal phenotype associated with the expression of the unc-5 death domain in yeast. They are also useful in yeast two hybrid experiments for identifying unknown human cDNAs which encode proteins that interact with the human unc-5C protein. AAC90914 to AAC99971 and AAB50693 represent sequences used in the exemplification of the consecution of the consecution of the consecution of the consecution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Three variants of human unc-5C cDNAs (unc-5Cb, unc-5Cc and unc-5C8) a human unc-5HS1 cDNA, useful in yeast two hybrid experiments for identifying unknown human cDNAs which encode proteins that interact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HPI;
                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 4; Page 197-202; 246pp;

Sequence 2, Application US/09241606
Patent No. 6472140
GEMERAL INFORMATION:
APPLICANT: Tanzi, Rudolph E.
APPLICANT: Kovacs, Dora
APPLICANT: Saunders, Aleister J.
TITLE OF INVENTION: Alpha-2-Macroglobulin Therapies and Drug
TITLE OF INVENTION: Alpha-6765 Applicants and Drug
TITLE OF INVENTION: Alpha-6765 Applicants and Drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SOFTWARE: PatentIn Ver. 2.0 SEQ ID NO 2
